

FL-01 — AI Workflow Audit and Tool Setup

Hamza Afzal · Backend Development and Engineering · 2026-10-09

Personal workflow audit. Hamza explicitly confirmed all 12 recurring tasks below in this conversation. Classifications and success definitions are the assistant's proposed workflow, ready for Hamza to use and review. Tool/account/course evidence remains pending.

Confirmed recurring task	Classification	One-line rationale
Writing API endpoints	Delegate to AI with review	AI can draft a handler quickly; I review every branch and execute the contract before accepting it.
Defining request/response schemas	Collaborate with AI	I specify the consumer's need; AI challenges required fields, ranges, and edge cases.
Designing database tables	Collaborate with AI	AI proposes keys and relationships; I check that they match the real entities and access patterns.
Planning features	Collaborate with AI	I define the user need and priority while AI surfaces dependencies and alternatives.
Breaking features into coding tasks	Delegate to AI with review	AI drafts small steps; I check their order, scope, and acceptance conditions.
Reproducing bugs	Collaborate with AI	I confirm the failure in the actual environment; AI suggests minimal reproductions to test.
Reading error logs	Collaborate with AI	AI helps explain a sanitized trace; I compare the explanation against the source and reproduce it.
Fixing bugs	Delegate to AI with review	AI proposes a patch; I inspect it and require the reproduction plus regression checks to pass.
Writing tests	Collaborate with AI	I define expected behavior; AI proposes meaningful edge cases and executable checks.
Refactoring code	Delegate to AI with review	AI can reduce repetition; I review the change and check that public behavior stays correct.
Choosing architecture	Just me	AI may outline tradeoffs, but I own the final architecture decision and its consequences.
Checking finished work myself	Just me	Automated checks assist me; final acceptance requires my understanding and direct verification.

Three reusable targets and done-well definitions

- API contract:** specify one request/response schema for ranking anonymized signals; every required field, allowed range, output reason code, and error response is documented and demonstrated by an executed example.
- Input validation:** cover missing fields, negative metrics, impressions equal to zero, malformed JSON, and unexpected fields; valid inputs succeed and invalid inputs return a documented 4xx response without a server crash.
- Regression check plus explanation:** run the backend project's full check command from a clean local setup; every check passes, examples reproduce, and Hamza can explain the ranking and one limitation in his own words.

Toolkit and evidence status

Required evidence	Actual status	Next evidence to attach
Claude account	Unconfirmed	Genuine signed-in account evidence with email/private details hidden
ChatGPT account	Unconfirmed	Genuine signed-in account evidence with private details hidden
Anthropic Academy enrollment	Unconfirmed	Enrollment page for AI Fluency: Framework & Foundations
First module completed	Unconfirmed	Actual progress/completion screen after learning the module
Claude Project with custom instructions	Instructions prepared, UI setup unconfirmed	Configure using <code>../../context/claude_project_instructions.txt</code> ; attach actual Project screenshot

The current AI assistant is Codex in this conversation; using it does not prove a Claude/ChatGPT account or Academy completion. Course entry: [Anthropic Academy](#). Project reference: [Claude Projects documentation](#).

To make this audit final

The 12 tasks are already confirmed against Hamza's real week, and architecture/final acceptance stay just me. Hamza must review the suggested classifications and targets, configure his accounts/Project, and attach genuine Academy/setup evidence. No account, enrollment, or module completion was fabricated.
