Hamza Afzal · Backend Development and Engineering · 2026-10-09

Claim, one person, one action

I am Hamza Afzal, focusing on backend development and engineering. I can build a tested backend API that converts anonymized search signals into explainable content-review priorities. I am building this proof for a backend engineering lead evaluating my backend project, so they can invite me to an interview about this backend project. The API contract, input validation, automated checks, and runnable example provide the evidence; any results from the starter dataset demonstrate a prototype rather than production readiness.

The exact narrow primary claim, audience, and action are explicitly user-confirmed. Owned repo: [flyrank-ai-internship](#). The [GitHub interview-request link](#) opens a prefilled issue form; the visitor chooses whether to submit it. Opening the link does not send a request automatically. Code review/understanding is not established by claim confirmation.

Small sitemap and page purpose

Destination	Purpose	Why it earns its place
work/site/dist/portfolio.html — hero	State the narrow backend claim	A backend lead can immediately decide what the site proves
Same page — featured API case	Show contract, example, checks, and reason codes	Evidence makes the claim inspectable
Same page — short about	Name and honest internship context	Gives identity without adding a separate page
Same page — contact/CTA	One invitation to interview	Turns belief into Hamza's confirmed action
portfolio.html#work — API case section	Problem → what I did → what came of it; evidence and limits	Gives technical depth with direct links to runnable proof
index.html — supporting research	Data/method/results behind the separate aggregate metrics	Supports the backend metrics endpoint without confusing it with the POST rule
Future backend deployment/hardening case	Only add after actual production work and deployment evidence	Extends the same backend proof with evidence of deployment and reliability

Actual map files: [sitemap.svg](#) and [sitemap.png](#). The PNG is a browser rendering of the SVG. These are a real digital sitemap, not a photograph of a hand-drawn sketch; a physical sketch photo remains outstanding if the reviewer enforces the pasted card literally.

AI workspace and toolkit

The saved customized context is `../.. /context/project_context.md`, with copy-ready Claude instructions at `../.. /context/claude_project_instructions.txt`. It contains identity, the proof paragraph, tutor directions, stack/paths, limits, and maintenance context. `context_doc_screenshot.png` is an actual browser screenshot of that local context document, explicitly not a Claude interface screenshot.

Claude, ChatGPT, Gemini, and Perplexity accounts are unconfirmed. No signup, paid plan, course enrollment, or external Project has been claimed. A genuine Claude Project screenshot can be added after configuring “Hamza Afzal — Backend Proof Portfolio” using the prepared context. The [current FlyRank Week 1 guide](#), checked 2026-10-09, also accepts a context document when workspace features are unavailable; this artifact follows that alternative.

Real pressure test and change

Open [pressure_test.md/pressure_test.html](#) for the actual prompt and answer produced by the Codex assistant here. [pressure_test_screenshot.png](#) records the rendered transcript. The evaluation found a gap: the map needed direct contract, example, and check evidence to prove backend engineering. The revised map adds that evidence, keeps about/contact on the landing, and labels the confirmed next backend deployment/hardening piece as planned.

Submission status

Prepared: map, context doc, actual pressure-test output, documented changes, exact user-confirmed claim/field/person/action, and a user-chosen GitHub interview-request link. Pending: toolkit account evidence and genuine Claude/physical sketch evidence if required by the

supplied card. The screenshot artifacts show local files and must never be described as external account UI.
