

General AI Fluency · Impact Project

Hamza Afzal · Backend Development and Engineering · 2026-10-09

Separate capstone deliverable. The two supplied General AI Fluency cards have identical maintenance briefs. Each folder includes its own note/evidence and copies of the shared context/reminder.

Exactly how to add the next case

1. Edit the `portfolio` case block in `work/scripts/build_site.py`, the source of truth. Use three beats: **problem** (local API → reliable production service), **what I did** (actual deployment/hardening), **what came of it** (verified behavior and limits).
2. Link source/configuration, deployment date/version, working HTTPS endpoint, authentication/rate-limit checks, tests, and rollback evidence. Keep secrets out; retain a planned label until the work exists.
3. If a separate page is useful, extend the builder to write `work/site/dist/cases/backend-api-deployment.html`; add that relative link to its featured-work section. Keep the GitHub interview-request action.
4. Run `python work/scripts/build_site.py` to regenerate `work/site/dist/portfolio.html`; review via `python -m http.server 8000 --directory work/site/dist`. Check links/mobile layout and the documented site checks, then verify the exact URL after authorized publication.
5. Update the saved context/reminder for the following case. Reuse the tutor instructions and review unsupported claims yourself.

Named next piece

Deploy and harden the backend review API — explicitly confirmed by Hamza. Planned scope: production hosting, HTTPS, authentication/rate limits, meaningful tests, rollback, and actual deployment evidence. The intention is confirmed; this production work is not done.

Concrete reminder evidence

The actual note is `work/context/portfolio_maintenance_reminder.md`, created 2026-10-09. First checkpoint: **Friday 2026-10-16 at 18:00 Asia/Karachi**, then every Friday until the case is added. It records the action/blocker steps; this local recurring note is permitted by the supplied brief. No notification service is configured.

The matching ICS is **not calendar-imported**. `reminder_screenshot.png` shows the actual local note, not calendar UI; `reminder_evidence.json` records its hash/due time. Copies of the note/ICS are included here.

Preserved tutor/build context

`work/context/project_context.md` preserves identity, proof, tutor instructions, stack, style, boundaries, and the confirmed next piece; `preserved_build_context.md` is the copy in this folder. External Claude Project UI is unconfirmed. The actual Codex pressure test is saved in the Draw the Path assignment folder.

Honest completion boundaries and source discrepancy

The local reminder/context exist; Hamza confirmed the next intention and GitHub interview action. Toolkit/Claude UI evidence remains unconfirmed. Repo: <https://github.com/Hamza2-2/flyrank-ai-internship>; see its submission index for publication status. Document scripts do not send messages or submit to the portal.

The [live Week 10 guide](#), checked 2026-10-09, adds a broader launch/demo/story package. This note follows the supplied maintenance card; check the current portal card before submission. A demo, badge, or showcase submission is not established by this note.
